Secant method is also a recursive method for finding the root for the polynomials by successive approximation. It's similar to the Regular-falsi method but here we don't need to check $f(x_1)f(x_2) < 0$ again and again after every approximation. In this method, the neighbourhoods roots are approximated by secant line or chord to the function $f(x)$.

the essence of the different methods, and that many problem can be solved with a code of a few lines. The particularly strong aspect is the large part dedicated to the solutions of PDEs, which appear in all areas in physics. In principle, one can show in a one semester course, how to solve all the undergrad physics problems numerically.
